

Allsafe Electric — Remediation Brief

For: the developer / Claude Code session building `all-safe-electric-web.vercel.app`
Read alongside: `allsafe-site-audit.md` (the full audit this is derived from)

Read this part first

A staging audit found a set of problems that fall into three groups: things the build got wrong, things that were never decided, and **things the planning docs told you to do that were wrong**. The third group is the important one.

Several defects trace directly back to the planning package, not to the build:

Defect on the site	Where it came from
Site built around Jud and Justin personally	<code>CLAUDE.md</code> §7, <code>docs/01</code> §3, <code>docs/02</code> §5
Every service page H1 ends "in Parker"	<code>docs/03</code> §3, the service table
Book/Estimate as primary CTA, phone secondary	<code>docs/02</code> §6.1, <code>docs/07</code> §1
Estimate form rendered twice per page	<code>docs/07</code> §1, the placement matrix
21-town link block on every service page	<code>docs/03</code> §7, internal linking rules
<code>meta-author: Judson Cushing</code> sitewide	<code>docs/09</code> §8, scoped to blog but applied globally
<code>noindex</code> placeholder city pages sitting in production	<code>docs/09</code> §3, the tier gates

So **fix the docs before you fix the site**. If you only fix the rendered pages, the next session reads the same instructions and regenerates the same problems. The docs are the source of truth; right now some of that truth is wrong.

Work in the order below. Part A is roughly two hours. Do not start Part B until it is done.

The direction change, in one line

The site sells **the company**, across a **21-community metro service area**. It does not sell two named electricians in Parker.

Jud is scaling. The old positioning — small on purpose, always the same two guys, Parker neighborhood electrician — caps the business and will have to be torn out the day he hires a third person. Every decision below follows from this.

Part A — Fix the planning docs

A1. CLAUDE.md

Line 6. Replace the owner/tech line with:

None

Client of Built Right Digital. Owner: Judson "Jud" Cushing, master electrician.

The site represents the COMPANY, not any individual. See §7.

§3, canonical business facts. Add these, which are now confirmed:

None

Google reviews: 149 Rating: 5.0

Founded: January 2018 (8 years in business)

Jud's experience: 15+ years as a master electrician (NOT the company's age)

GBP type: Location-based at 11479 Pine Dr M-51 – citations must match exactly

Service area: 21 communities across 4 counties, all confirmed serviceable

§7, tone of voice. This section currently instructs you to write about Jud personally. Replace the example and add a hard rule:

Never name an individual employee in site copy. Trust promises are company standards, not personal ones. "A real person answers the phone" is correct. "Jud answers his own phone" is not — it breaks the day he hires a dispatcher.

Justin does not appear anywhere on the site. Not in copy, metadata, alt text, schema, or image filenames. The only exception is verbatim customer review text, which is the customer's words and stays unedited.

Jud's name appears in exactly two places: the blog author byline (with `Person` schema and an author page) and one founder section on About, framed as the origin of the company's standards. Nowhere else.

§5, known traps. Add:

Trap	What to do
Vendor names in customer-facing copy	Never say "Housecall Pro" to a visitor. Say "book online any time." Same for CallRail, Vercel, any tool.
Doc references leaking into body copy	Never write "Tier 0," "docs/09 §3," "indexation gate," or "staging note" into rendered output. Three of these shipped.
British spellings	American English only. <code>aluminum</code> , <code>neighborhood</code> , <code>minimize</code> . "Aluminium wiring" is also a keyword mismatch.
Two URL patterns for one page type	One pattern per page type, enforced in CI. Two complete city-page sets shipped.

§6, definition of done. Add: "Contains no individual employee name, no vendor name, no doc reference, no British spelling, and no number that isn't sourced from `lib/business.ts`."

A2. `docs/01-client-brief.md`

- Delete Justin from §1 and from the trust assets list.
- Rewrite §3 wholesale. The transcript quotes are still the right *insight* — the buyer is screening for trust and reliability — but the conclusion drawn from them was wrong. Keep the audience analysis (§3.1, §3.2), keep the design constraints (§3.3), keep the color correction (§3.5). Rewrite §3.4 so the differentiator is a company promise: a real person answers, a two-hour arrival window, a fixed price before work starts, shoe covers on, no upsell.
- Add a new §3.10, **Positioning**: Jud is scaling. The site is written for a growing company covering the south Denver metro. Nothing in the copy may assume a fixed headcount or a single person doing the work.

- Correct the review figures to 149 / 5.0 and note the 8-years-in-business vs 15-years-experience distinction.

A3. docs/02-design-system.md

- **§5, the hero.** Remove "A real person picks up. Usually Jud." and the subhead naming both men. Replacement headline direction: the company answers and shows up. The hero photo can still be a real photo of a working electrician; it just isn't captioned as Jud.
- **§6.2, availability strip.** Change "Jud answers this line" to "A real person answers."
- **§6.1, buttons. Invert the hierarchy.** Phone is the primary filled button; estimate is secondary. On the emergency page phone is the only prominent action. A form is the wrong response to a burning smell.
- **§4, wireframe.** Update the hero and availability strip to match the above.
- **§8, imagery.** Remove "Jud and Justin, clearly, repeatedly." Replace with "real Allsafe electricians at work in real homes, unnamed."
- **Add a new §11, Section budget.** This is the fix for the "window blocks" problem:

A page gets **five or six content sections**. Not twelve. Before adding a section, delete one.

Banned as a default: eyebrow labels above every heading, four-box stat strips on interior pages, numbered card grids for non-sequential content, a bordered box around every block. These are the specific visual signature of generated sites and buyers recognize it now.

Let content be prose in a plain container. Vary layout meaningfully between page types — a service page, a city page and About should not read as one template with different words.

Boilerplate ratio: the repeated bottom-of-page block (CTA + form + footer) must not exceed **25% of a page's rendered text**. On short service pages it currently outweighs the unique content, which is a real ranking problem, not a taste one.

A4. docs/03-information-architecture.md

- **§3, service table.** Strip "in Parker" from all 16 H1s and titles. Pattern becomes *"Home wiring repair and rewiring | South Denver Metro | Allsafe Electric."* Parker appears in body copy where it is genuinely relevant, not in the H1 of every page.
- **§3, URLs.** Change two:
 - `/electrical-services-parker-co/` → `/electrical-services/`

- `/emergency-electrical-repairs-parker-co/` → `/emergency-electrical-repairs/`
- **Be aware this contradicts the preservation rule in docs/04, deliberately.** Both old URLs are indexed on the live site and carry equity, so this is not free — the audit's "redirects cost nothing" is slightly optimistic. A 301 carries the large majority of it, and the strategic cost of baking one city into the two highest-intent URLs is higher than the transfer loss. 301 both, keep them in `preserved-urls.csv` as redirect targets, and monitor them specifically in the first 30 days. Log this in `docs/99`.
- **§4, city pages.** One pattern only: `/electricians/[city]-co/`. Delete any mention of the flat `/electrician-[city]/` form. All **21** communities get a page; the tier system now governs *build order*, not whether a page exists.
- **§4. Rename the label from "towns" to "21 communities across four counties."** Stonegate and The Pinery are Parker neighborhoods; Dove Valley and Acres Green are CDPs. Structure in tiers: incorporated cities first, then neighborhoods and unincorporated areas.
- **§7, internal linking.** Replace "every service page links to its 5 Tier-1 city variants" with: **three or four contextual city links chosen for relevance**. No 21-item flat link block on any page. Sitewide boilerplate link blocks dilute rather than concentrate.
- Add: **one canonical list of communities, in data/service-areas.csv, rendered from that single source everywhere.** Three lists currently disagree with each other.

A5. docs/07-conversion-spec.md

- **§1, placement matrix.** Phone becomes the primary action in every row. Estimate is secondary.
- **§1.** The estimate form renders **once per page**, in the bottom block. Delete the mid-page form row. The homepage currently has two.
- **§1.** Estimate CTAs link to an **on-page anchor** to the form already on that page, not to `/contact/#estimate`. Sending a visitor to another page to reach an identical form 400px below them is a straightforward conversion leak. `/contact/` stays as a nav item only.
- **§1, mobile sticky bar.** Cut from three actions to two: **Call** dominant, plus one secondary matching the on-page conversion path. Book and Estimate are currently the same intent competing with each other.
- **Add §1.1, CTA honesty.** "Free Estimate" contradicts the FAQ's diagnostic fee. Either rename the button ("*Get a Quote*" / "*Book a Visit*") or surface the free-vs-paid distinction at the CTA itself. It cannot stay buried in an FAQ while the button says free.

- §5. Remove "reviews naming Jud and Justin personally." Review *display* is unaffected; this is about our sentences describing the reviews.

A6. docs/06-schema-spec.md and docs/09-content-plan.md

- `meta-author` sitewide is **Allsafe Electric**. `Person` / Judson Cushing appears only in `Article` schema on blog posts and on his author page. Scope this explicitly in docs/09 §8 — it was written for blog attribution and got applied globally.
- `areaServed` in the root entity covers **all 21 communities**, not five.
- If `aggregateRating` is ever added, it reads from `lib/business.ts` and must equal the real GBP numbers. The 400+ vs 148 conflict on the site is exactly the failure mode the no-invented- numbers rule exists to prevent.

A7. docs/09-content-plan.md — the tier gates

The gates were written to prevent repeating the old site's 493 unindexed pages. **That reasoning still holds and the gates stay.** But they were misapplied: the build shipped noindex placeholder city pages into production with staging notes in the body copy. Clarify:

A page is either published properly or it does not exist in the build. **Never ship a noindex placeholder.** The gate governs when a page gets written and released, not whether a stub sits in production waiting.

Also add, per audit §3.7: all 21 city pages need genuinely local detail — permit authority, electric utility (CORE vs Xcel splits across this footprint and is a real differentiator), housing stock and era, panel brands that turn up there. A page that is the Parker page with the city swapped will not rank, and 21 of them will drag the domain. **This is the largest content workload on the project. Scope it before committing to a launch date.**

A8. docs/12-migration-runbook.md

Staging must be `X-Robots-Tag: noindex` at the Vercel domain level **or** password protected. The preview is currently fully indexable with canonicals pointing at the production domain. Make this a pre-flight checklist item, not a note.

A9. docs/99-decisions-log.md

Log every decision above with its reasoning. Then close these, which the client has answered:

- Justin comes off entirely
 - 149 reviews, 5.0 rating
 - All 21 locations serviceable
 - GBP is location-based at 11479 Pine Dr M-51
 - Jud is scaling; site written for a growing company
 - Jud gets a blog byline and one founder section
-

Part B — Fix the site

Only after Part A. Work in this order.

B1. Launch blockers

1. **Strip internal planning notes from rendered output.** Three confirmed instances on `/electricians/parker-co/`, `/service-area/` and `/about/`. Grep the whole codebase for `Tier 0`, `Tier 1`, `indexation`, `staging note`, `planning/docs`, `docs/0`, `§`, `noindex`). Three separate instances means there are more.
2. **Resolve the duplicate city-page sets.** Keep `/electricians/[city]-co/`, 301 every `/electrician-[city]/` into it, delete the duplicate content rather than just redirecting — the two versions share paragraphs verbatim. Then repoint every internal link. The service area page currently links *exclusively* to the noindex set, so the indexable city pages get no link from the one page whose entire job is linking to them.
3. **Lock down the Vercel preview.**
4. **Consolidate to one header and one footer component.** Two of each are in production; the stripped header is missing Emergency Repairs, Reviews, Coupons and Contact.
5. **Unify header CTA targets** to whatever Part A §A5 settled.

B2. De-personalize

Work the removal list in audit §2.2 exactly. Then search-and-replace the anti-scale phrases in §2.3 across all 16 service pages and all 21 city pages. Reframe each as a company standard — the underlying trust signals are good and all of them survive hiring.

Rewrite the About page around the company: licensed, insured, owner-operated standards, work done to the same standard on every job. Keep one founder section. Delete timeline milestone 4 ("Still deliberately two people") entirely — it publicly commits Jud to never hiring.

Fix the credentials line: ME.0601023 and EC.0101068 are both Jud's, master and contractor. Word them as the company's licenses, not one per person.

Leave customer testimonial text alone. Todd's and Mark's reviews name Justin; that is the customer's wording and it stays verbatim.

B3. Geography

Apply the URL, title and H1 changes from §A4. Rebuild the service area page as a metro-level coverage statement, then tiered city groupings by county with **every** community linked, then the map. Parker neighborhoods move to the Parker city page.

Rewrite the homepage service area section to lead with cities, not five Parker subdivisions. Rewrite the footer tagline to the metro.

Pull reviews from Castle Rock, Highlands Ranch, Lone Tree and Centennial into rotation. Every testimonial on the site is currently tagged Parker, which reinforces exactly the perception we are dismantling.

B4. Single source of truth for facts

Create `lib/business.ts` exporting every number and string that appears more than once: review count, rating, founding year, years of experience, phone, address, hours, license numbers, service area list. **Nothing in a component or MDX file hardcodes any of these.** The 400+ vs 148 vs 149 conflict and the 15 vs 8 years conflict both exist because the same fact was typed in three places.

Resolve, using the audit §5 table: **149 reviews, 5.0 rating, 8 years in business, 15+ years of master electrician experience.** The last two are both true and should be stated as the two distinct things they are.

B5. Copy cleanup

Proofread all 16 service pages and all 21 city pages for the de-personalization find-and-replace artifacts: "and **We** come out," "**tells** you honestly," "name **them both** personally." Fixing the three named instances is not the task; the pattern is.

Convert British spellings to American throughout.

Fix the broken TOC anchor on the wiring page (`#not-included-heading`) and check the TOC generator against rendered sections on every service page.

B6. Design

Apply the section budget from §A3. Cut service pages to five or six sections, drop stat strips on interior pages, render the form once, replace the 21-item link block with three or four contextual links, vary layout between page types.

B7. Technical QA

Work audit §8 in full. Particularly: `areaServed` covering all 21 communities, sitemap excluding every `noindex` and 301 URL, canonicals re-verified after the URL changes, About page image weight (nine gallery images plus four inline at `w=2400`), the duplicated `allsafe-electrician-holding-dog.jpg`, and badge links currently pointing at `/about/#credentials` rather than real verification profiles.

Part C — New CI checks

Add these to `npm run audit:seo`. Every one of them corresponds to something that actually shipped, so they are not hypothetical.

Build fails on:

- The string `Justin` anywhere outside a file marked as verbatim customer review content
- Any individual employee name in an H1, title, meta description, OG tag, or `meta-author`
- `Housecall Pro`, `CallRail`, `Vercel`, or any vendor name in rendered customer-facing copy
- `Tier 0`, `Tier 1`, `indexation`, `staging note`, `planning/docs`, `docs/0` in rendered output
- British spellings: `aluminium`, `neighbourhood`, `minimise`, `colour`, `organise`
- A hardcoded review count, rating, or year that doesn't come from `lib/business.ts`
- More than one header or footer component resolving in the route tree
- Two URL patterns resolving for the same page type
- More than one `<form>` with the estimate fields on a single page
- A TOC anchor with no matching heading id
- A `noindex` page present in the sitemap
- Any page where boilerplate exceeds 25% of rendered text
- A page with more than 7 content sections

Warns on:

- A service or city page whose H1 contains a single city name
 - A link block with more than 6 city links
 - Any page with more than 2 stat strips or card grids
-

Part D — Needs an answer from Jud before launch

These are business decisions and nobody should guess at them:

1. **Emergency offer.** Is there one? What are the real hours? The homepage claims "60 min average response" while the rest of the site says weekdays 8–6. That number is a promise the business hasn't agreed to make. Resolve or remove it.
 2. **Price ranges.** Are \$350–\$8,000 (wiring) and \$2,200–\$4,500 (panels) current, and will he honor them in Denver and Lakewood the same as in Parker?
 3. **Next hire, and in what role.** A dispatcher turns "a real person answers" from a personal promise into an operational one, which is the copy we want either way.
 4. **Citation cleanup access.** Can we fix BBB and Yellow Pages, or does he need to? This matters more than usual now that the GBP is location-based: BBB carries three separate records with three different unit designators, Yellow Pages has a different street address *and* a different phone number. Google is matching that exact address string against citations and right now it matches nothing. Treat this as launch-adjacent, not an afterthought.
 5. **Experience claim.** Yelp and Nextdoor say "over 20 years," the site says 15+. One number, everywhere.
 6. **HomeAdvisor badge.** Their profile shows 4.7 against a 5.0 Google rating displayed on the site. If the badge links out, those sit side by side. Decide whether it earns its place.
-

Acceptance criteria

Do not call this done until:

- [] Every doc change in Part A is committed, and `docs/99` records why
- [] `grep -ri "justin" src/` returns only verbatim review content
- [] No individual name appears in any H1, title, meta, or `meta-author`

- [] One header component, one footer component, one city URL pattern
- [] Zero planning references, vendor names, or British spellings in rendered output
- [] Every fact that appears twice comes from [lib/business.ts](#)
- [] Phone is the primary CTA on every page; estimate CTAs are on-page anchors
- [] One estimate form per page
- [] All 21 communities render from one data source and every one is linked
- [] Service page H1s target the metro, not a single city
- [] Preview domain is noindexed or password protected
- [] All new CI checks pass, and you have proven at least three of them fail on bad input
- [] No service page exceeds six content sections
